Thoroughly updated to reflect the tremendous technological leaps made since the publication of the first edition, this book covers the gamut of knowledge and skills needed to work in this dynamic field, including:

- * Physics involved in wave-matter interaction, the building blocks for interpreting data
- * Techniques used

to collect data * Remote sensing applications The authors have carefully structured and

organized the book to introduce readers to the basics, and then move on to more advanced applications.

Following an introduction, Chapter 2 sets forth the basic properties of electromagnetic waves

cases, a specific advanced sensor is used for illustration. The book is generously illustrated with fifty percent new figures. Numerous illustrations are reproduced in a separate section of color plates. Examples of data acquired from spaceborne sensors are included throughout.

Finally, a set of exercises, along with solutions manual, is provided. This book is based on an upper-level undergraduate and first-year graduate course taught by the authors at the California Institute of Technology.
